Randomized Algorithms

- Turing machines do not inherently have access to randomness.
- Assume algorithm has also access to a stream of **random bits** drawn uniformly at random.
- With r random bits, the probability space is the set of all 2^r possible strings of random bits (with uniform distribution).

Las Vegas algorithms

Definition 1

A **Las Vegas algorithm** is a randomized algorithm whose output is always correct.

Randomness is used to upper bound the expected running time of the algorithm.

Example

Quicksort with random choice of pivot.

Definition 2

- A **Monte Carlo algorithm** is an algorithm whose output is incorrect with probability at most p , $0 < p < 1$.
- A Monte Carlo has **one sided** error if its output is incorrect only on **YES**-instances or on **NO**-instances, but not both.
- A one-sided error Monte Carlo algorithm with **false negatives** answers **NO** for every **NO**-instance, and answers **YES** on **YES**-instances with probability $p \in (0, 1)$. We say that p is the *success probability* of the algorithm.

Algorithms with increased success probability

Boosting success probability

Suppose A is a one-sided Monte Carlo algorithm with false negatives with success probability p . How can we use A to design a new one-sided Monte Carlo algorithm with success probability $p^* > p$?

Algorithms with increased success probability

Boosting success probability

Suppose A is a one-sided Monte Carlo algorithm with false negatives with success probability p . How can we use A to design a new one-sided Monte Carlo algorithm with success probability $p^* > p$?

Let $t = -\frac{\ln(1-p^*)}{p}$ and run the algorithm t times. Return **YES** if at least one run of the algorithm returned **YES**, and **NO** otherwise.

Algorithms with increased success probability

Boosting success probability

Suppose A is a one-sided Monte Carlo algorithm with false negatives with success probability p . How can we use A to design a new one-sided Monte Carlo algorithm with success probability $p^* > p$?

Let $t = -\frac{\ln(1-p^*)}{p}$ and run the algorithm t times. Return **YES** if at least one run of the algorithm returned **YES**, and **NO** otherwise. Failure probability is

$$(1-p)^t \leq (e^{-p})^t = e^{-p \cdot t} = e^{\ln(1-p^*)} = 1 - p^*$$

via the inequality $1 - x \leq e^{-x}$.

Algorithms with increased success probability

Boosting success probability

Suppose A is a one-sided Monte Carlo algorithm with false negatives with success probability p . How can we use A to design a new one-sided Monte Carlo algorithm with success probability $p^* > p$?

Let $t = -\frac{\ln(1-p^*)}{p}$ and run the algorithm t times. Return **YES** if at least one run of the algorithm returned **YES**, and **NO** otherwise. Failure probability is

$$(1-p)^t \leq (e^{-p})^t = e^{-p \cdot t} = e^{\ln(1-p^*)} = 1 - p^*$$

via the inequality $1 - x \leq e^{-x}$.

Definition 3

A **randomized algorithm** is a one-sided Monte Carlo algorithm with **constant** success probability.

Theorem 4

If a one-sided error Monte Carlo algorithm has success probability at least p , then repeating it independently $\lceil \frac{1}{p} \rceil$ times gives constant success probability.

In particular if we have a polynomial-time one-sided error Monte Carlo algorithm with success probability $p = \frac{1}{f(k)}$ for some computable function f , then we get a randomized **FPT** algorithm with running time $O^*(f(k))$.

Vertex Cover

For a graph $G = (V, E)$ a **vertex cover** $X \subseteq V$ is a set of vertices such that every edge is adjacent to a vertex in X .

VERTEX COVER

Input: Graph G , integer k

Parameter: k

Question: Does G have a vertex cover of size k ?

Vertex Cover

For a graph $G = (V, E)$ a **vertex cover** $X \subseteq V$ is a set of vertices such that every edge is adjacent to a vertex in X .

VERTEX COVER

Input: Graph G , integer k

Parameter: k

Question: Does G have a vertex cover of size k ?

Warm-up: design a randomized algorithm with running time $O^*(2^k)$.

Randomized Algorithm for Vertex Cover

Algorithm $\text{rvc}(G = (V, E), k)$

$S \leftarrow \emptyset$

while $k > 0$ and $E \neq \emptyset$ **do**

 Select an edge $uv \in E$ uniformly at random

 Select an endpoint $w \in \{u, v\}$ uniformly at random

$S \leftarrow S \cup \{w\}$

$G \leftarrow G - w$

$k \leftarrow k - 1$

if S is a vertex cover of G **then**

return **YES**

else

return **No**

Success probability

- Let C be a minimal (inclusion-wise minimal) vertex cover of G of size $k' \leq k$
- What is the probability that Algorithm `rvc` returns C ?
- When it selects an edge $uv \in E$, we have that $\{u, v\} \cap C \neq \emptyset$
- When it selects a random endpoint $w \in \{u, v\}$, we have that $w \in C$ with probability $\geq 1/2$
- It finds C with probability at least $1/2^{k'}$

Randomized Algorithm for Vertex Cover

Theorem 5

VERTEX COVER has a randomized algorithm with running time $O^*(2^k)$.

Proof.

- If G has vertex cover number at most k , then Algorithm `rvc` finds one with probability at least $\frac{1}{2^k}$.
- Applying Theorem 4 gives a randomized FPT running time of $O^*(2^k)$.

Feedback Vertex Set

A **feedback vertex set** of a multigraph $G = (V, E)$ is a set of vertices $S \subset V$ such that $G - S$ is acyclic.

FEEDBACK VERTEX SET

Input: Multigraph G , integer k

Parameter: k

Question: Does G have a feedback vertex of size k ?

Feedback Vertex Set

A **feedback vertex set** of a multigraph $G = (V, E)$ is a set of vertices $S \subset V$ such that $G - S$ is acyclic.

FEEDBACK VERTEX SET

Input: Multigraph G , integer k

Parameter: k

Question: Does G have a feedback vertex of size k ?

Recall the following simplification rules for FEEDBACK VERTEX SET.

Simplification Rules

- 1 Loop: If loop at vertex v , remove v and decrease k by 1
- 2 Multiedge: Reduce the multiplicity of each edge with multiplicity ≥ 3 to 2.
- 3 Degree-1: If v has degree at most 1 then remove v .
- 4 Degree-2: If v is incident to exactly two edges uv, vw , then delete these 2 edges uv, vw and add a new edge uw .

The solution is incident to a constant fraction of the edges

Lemma 6

Let G be a multigraph with minimum degree at least 3. Then, for every feedback vertex set X of G , at least $1/3$ of the edges have at least one endpoint in X .

The solution is incident to a constant fraction of the edges

Lemma 6

Let G be a multigraph with minimum degree at least 3. Then, for every feedback vertex set X of G , at least $1/3$ of the edges have at least one endpoint in X .

Proof.

Denote by n and m the number of vertices and edges of G , respectively.

Since $\delta(G) \geq 3$, we have that $m \geq 3n/2$.

Let $F := G - X$.

Since F has at most $n - 1$ edges, at least $\frac{1}{3}$ of the edges have an endpoint in X . □

Theorem 7

FEEDBACK VERTEX SET *has a randomized algorithm with running time $O^*(6^k)$.*

Theorem 7

FEEDBACK VERTEX SET *has a randomized algorithm with running time $O^*(6^k)$.*

We prove the theorem using the following algorithm.

- $S \leftarrow \emptyset$
- Do k times: Apply simplification rules; add a random endpoint of a random edge to S .
- If S is a feedback vertex set, return **YES**, otherwise return **NO**.

Proof.

- We need to show: each time the algorithm adds a vertex v to S , if $(G - S, k - |S|)$ is a **YES**-instance, then with probability at least $1/6$, the instance $(G - (S \cup \{v\}), k - |S| - 1)$ is also a **YES**-instance. Then, by induction, we can conclude that with probability $1/(6^k)$, the algorithm finds a feedback vertex set of size at most k if it is given a **YES**-instance.

Proof.

- We need to show: each time the algorithm adds a vertex v to S , if $(G - S, k - |S|)$ is a **YES**-instance, then with probability at least $1/6$, the instance $(G - (S \cup \{v\}), k - |S| - 1)$ is also a **YES**-instance. Then, by induction, we can conclude that with probability $1/(6^k)$, the algorithm finds a feedback vertex set of size at most k if it is given a **YES**-instance.
- Assume $(G - S, k - |S|)$ is a **YES**-instance.
- Lemma 6 implies that with probability at least $1/3$, a randomly chosen edge uv has at least one endpoint in some feedback vertex set of size $k - |S|$.
- So, with probability at least $\frac{1}{2} \cdot \frac{1}{3} = \frac{1}{6}$, a randomly chosen endpoint of uv belongs some feedback vertex set of size $\leq k - |S|$.

Proof.

- We need to show: each time the algorithm adds a vertex v to S , if $(G - S, k - |S|)$ is a **YES**-instance, then with probability at least $1/6$, the instance $(G - (S \cup \{v\}), k - |S| - 1)$ is also a **YES**-instance. Then, by induction, we can conclude that with probability $1/(6^k)$, the algorithm finds a feedback vertex set of size at most k if it is given a **YES**-instance.
- Assume $(G - S, k - |S|)$ is a **YES**-instance.
- Lemma 6 implies that with probability at least $1/3$, a randomly chosen edge uv has at least one endpoint in some feedback vertex set of size $k - |S|$.
- So, with probability at least $\frac{1}{2} \cdot \frac{1}{3} = \frac{1}{6}$, a randomly chosen endpoint of uv belongs some feedback vertex set of size $\leq k - |S|$.
- Applying Theorem 4 gives a randomized **FPT** running time of $O^*(6^k)$.

Lemma 8

Let G be a multigraph with minimum degree at least 3. For every feedback vertex set X , at least $1/2$ of the edges of G have at least one endpoint in X .

Lemma 8

Let G be a multigraph with minimum degree at least 3. For every feedback vertex set X , at least $1/2$ of the edges of G have at least one endpoint in X .

Note: For a feedback vertex set X , consider the forest $F := G - X$. The statement is equivalent to:

$$|E(G) \setminus E(F)| \geq |E(F)|$$

Let $J \subseteq E(G)$ denote the edges with one endpoint in X , and the other in $V(F)$. We will show the stronger result:

$$|J| \geq |V(F)|$$

Proof.

- Let $V_{\leq 1}, V_2, V_{\geq 3}$ be the set of vertices that have degree at most 1, exactly 2, and at least 3, respectively, in F .

Improved analysis

Proof.

- Let $V_{\leq 1}, V_2, V_{\geq 3}$ be the set of vertices that have degree at most 1, exactly 2, and at least 3, respectively, in F .
- Since $\delta(G) \geq 3$, each vertex in $V_{\leq 1}$ contributes at least 2 edges to J , and each vertex in V_2 contributes at least 1 edge to J .

Improved analysis

Proof.

- Let $V_{\leq 1}, V_2, V_{\geq 3}$ be the set of vertices that have degree at most 1, exactly 2, and at least 3, respectively, in F .
- Since $\delta(G) \geq 3$, each vertex in $V_{\leq 1}$ contributes at least 2 edges to J , and each vertex in V_2 contributes at least 1 edge to J .
- We show that $|V_{\geq 3}| \leq |V_{\leq 1}|$ by induction on $|V(F)|$.
 - Trivially true for forests with at most 1 vertex.
 - Assume true for forests with at most $n - 1$ vertices.
 - For any forest on n vertices, consider removing a leaf (which must always exist) to obtain F' with the vertex partition $(V'_{\leq 1}, V'_2, V'_{\geq 3})$.
If $|V_{\geq 3}| = |V'_{\geq 3}|$, then we have that $|V_{\geq 3}| = |V'_{\geq 3}| \leq |V'_{\leq 1}| \leq |V_{\leq 1}|$.
Otherwise, $|V_{\geq 3}| = |V'_{\geq 3}| + 1 \leq |V'_{\leq 1}| + 1 = |V_{\leq 1}|$.

Improved analysis

Proof.

- Let $V_{\leq 1}, V_2, V_{\geq 3}$ be the set of vertices that have degree at most 1, exactly 2, and at least 3, respectively, in F .
- Since $\delta(G) \geq 3$, each vertex in $V_{\leq 1}$ contributes at least 2 edges to J , and each vertex in V_2 contributes at least 1 edge to J .
- We show that $|V_{\geq 3}| \leq |V_{\leq 1}|$ by induction on $|V(F)|$.
 - Trivially true for forests with at most 1 vertex.
 - Assume true for forests with at most $n - 1$ vertices.
 - For any forest on n vertices, consider removing a leaf (which must always exist) to obtain F' with the vertex partition $(V'_{\leq 1}, V'_2, V'_{\geq 3})$.
If $|V_{\geq 3}| = |V'_{\geq 3}|$, then we have that $|V_{\geq 3}| = |V'_{\geq 3}| \leq |V'_{\leq 1}| \leq |V_{\leq 1}|$.
Otherwise, $|V_{\geq 3}| = |V'_{\geq 3}| + 1 \leq |V'_{\leq 1}| + 1 = |V_{\leq 1}|$.
- We conclude that:

$$|E(G) \setminus E(F)| \geq |J| \geq 2|V_{\leq 1}| + |V_2| \geq |V_{\leq 1}| + |V_2| + |V_{\geq 3}| = |V(F)|$$

Improved Randomized Algorithm

Theorem 9

FEEDBACK VERTEX SET *has a randomized algorithm with running time $O^*(4^k)$.*

Note

This algorithmic method is applicable whenever the vertex set we seek is incident to a constant fraction of the edges.

Longest Path

LONGEST PATH

Input: Graph G , integer k

Parameter: k

Question: Does G have a path on k vertices as a subgraph?

Longest Path

LONGEST PATH

Input: Graph G , integer k

Parameter: k

Question: Does G have a path on k vertices as a subgraph?

NP-complete

To show that LONGEST PATH is NP-hard, reduce from HAMILTONIAN PATH by setting $k = n$ and leaving the graph unchanged.

Color Coding

Notation: $[k] = \{1, 2, \dots, k\}$

Lemma 10

Let U be a set of size n , and let $X \subseteq U$ be a subset of size k . Let $\chi : U \rightarrow [k]$ be a coloring of the elements of U , chosen uniformly at random. Then the probability that the elements of X are colored with pairwise distinct colors is at least e^{-k} .

Color Coding

Notation: $[k] = \{1, 2, \dots, k\}$

Lemma 10

Let U be a set of size n , and let $X \subseteq U$ be a subset of size k . Let $\chi : U \rightarrow [k]$ be a coloring of the elements of U , chosen uniformly at random. Then the probability that the elements of X are colored with pairwise distinct colors is at least e^{-k} .

Proof.

There are k^n possible colorings χ and $k!k^{n-k}$ of them are injective on X . Using the inequality

$$k! > (k/e)^k,$$

the lemma follows since

$$\frac{k! \cdot k^{n-k}}{k^n} > \frac{k^k \cdot k^{n-k}}{e^k \cdot k^n} = e^{-k}.$$

Colorful Path

A path is **colorful** if all vertices of the path are colored with pairwise distinct colors.

Lemma 11

Let G be an undirected graph, and let $\chi : V(G) \rightarrow [k]$ be a coloring of its vertices with k colors. There is an algorithm that checks in time $O^(2^k)$ whether G contains a colorful path on k vertices.*

Proof.

Partition $V(G)$ into V_1, \dots, V_k subsets such that vertices in V_i are colored i .

Colorful Path II

Proof.

Partition $V(G)$ into V_1, \dots, V_k subsets such that vertices in V_i are colored i .
Apply dynamic programming on nonempty $S \subseteq \{1, \dots, k\}$. For $u \in \bigcup_{i \in S} V_i$ let $P(S, u) = 1$ if there is a colorful path with colors from S and u as an endpoint.

Colorful Path II

Proof.

Partition $V(G)$ into V_1, \dots, V_k subsets such that vertices in V_i are colored i . Apply dynamic programming on nonempty $S \subseteq \{1, \dots, k\}$. For $u \in \bigcup_{i \in S} V_i$ let $P(S, u) = 1$ if there is a colorful path with colors from S and u as an endpoint. We have the following:

- For $|S| = 1$, $P(S, u) = 1$ for $u \in V(G)$ iff $S = \{\chi(u)\}$.
- For $|S| > 1$

$$P(S, u) = \begin{cases} \bigvee_{uv \in E(G)} P(S \setminus \{\chi(u)\}, v) & \text{if } \chi(u) \in S \\ 0 & \text{otherwise} \end{cases}$$

Colorful Path II

Proof.

Partition $V(G)$ into V_1, \dots, V_k subsets such that vertices in V_i are colored i . Apply dynamic programming on nonempty $S \subseteq \{1, \dots, k\}$. For $u \in \bigcup_{i \in S} V_i$ let $P(S, u) = 1$ if there is a colorful path with colors from S and u as an endpoint. We have the following:

- For $|S| = 1$, $P(S, u) = 1$ for $u \in V(G)$ iff $S = \{\chi(u)\}$.
- For $|S| > 1$

$$P(S, u) = \begin{cases} \bigvee_{uv \in E(G)} P(S \setminus \{\chi(u)\}, v) & \text{if } \chi(u) \in S \\ 0 & \text{otherwise} \end{cases}$$

All values of P can be computed in $O^*(2^k)$ time and there exists a colorful k -path iff $P([k], v) = 1$ for some vertex $v \in V(G)$. \square

Theorem 12

LONGEST PATH *has a randomized algorithm with running time $O^*((2 \cdot e)^k)$.*

Note

This algorithmic method is applicable whenever we seek a subgraph of size $f(k)$ with constant treewidth.

Exponential-time algorithms and parameterized algorithms

Exponential-time algorithms

- Algorithms for **NP**-hard problems
- Beat brute-force & improve
- Running time measured in the size of the universe n
- $O(2^n \cdot n)$, $O(1.5086^n)$, $O(1.0892^n)$

Parameterized algorithms

- Algorithms for **NP**-hard problems
- Use a parameter k
(often k is the solution size)
- Algorithms with running time $f(k) \cdot n^c$
- $k^k n^{O(1)}$, $5^k n^{O(1)}$, $O(1.2738^k + kn)$

Can we use Parameterized algorithms to design fast Exponential-time algorithms?

Example: Feedback Vertex Set

$S \subseteq V$ is a **feedback vertex set** in a graph $G = (V, E)$ if $G - S$ is acyclic.

FEEDBACK VERTEX SET

Input: Graph $G = (V, E)$, integer k

Parameter: k

Question: Does G have a f.v.s. of size at most k ?

Example: Feedback Vertex Set

$S \subseteq V$ is a **feedback vertex set** in a graph $G = (V, E)$ if $G - S$ is acyclic.

FEEDBACK VERTEX SET

Input: Graph $G = (V, E)$, integer k

Parameter: k

Question: Does G have a f.v.s. of size at most k ?

Exponential-time algorithms

- $O^*(2^n)$ trivial
- $O(1.7548^n)$ (Fomin, Gaspers, Pyatkin, et al., 2008)
- $O(1.7347^n)$ (Fomin and Villanger, 2010)
- $O(1.7266^n)$ (Xiao and Nagamochi, 2015)

Parameterized algorithms

- $O^*((17k^4)!) (Bodlaender, 1994)$
- $O^*((2k + 1)^k) (Downey and Fellows, 1999)$
- \vdots
- $O^*(3.460^k)$ deterministic (Iwata and Kobayashi, 2019)
- $O^*(2.7^k)$ randomized (Li and

Exponential-time algorithms via parameterized algorithms

Binomial coefficients

$$\arg \max_{0 \leq k \leq n} \binom{n}{k} = n/2 \quad \text{and} \quad \binom{n}{n/2} = \Theta(2^n / \sqrt{n})$$

Exponential-time algorithms via parameterized algorithms

Binomial coefficients

$$\arg \max_{0 \leq k \leq n} \binom{n}{k} = n/2 \quad \text{and} \quad \binom{n}{n/2} = \Theta(2^n / \sqrt{n})$$

Algorithm for FEEDBACK VERTEX SET

- Set $t = 0.6511 \cdot n$
- If $k \leq t$, run $O^*(2.7^k)$ algorithm
- Else check all $\binom{n}{k}$ vertex subsets of size k

$$\text{Running time: } O^* \left(\max \left(2.7^t, \binom{n}{t} \right) \right) = O^*(1.9093^n)$$

Exponential-time algorithms via parameterized algorithms

Binomial coefficients

$$\arg \max_{0 \leq k \leq n} \binom{n}{k} = n/2 \quad \text{and} \quad \binom{n}{n/2} = \Theta(2^n / \sqrt{n})$$

Algorithm for FEEDBACK VERTEX SET

- Set $t = 0.6511 \cdot n$
- If $k \leq t$, run $O^*(2.7^k)$ algorithm
- Else check all $\binom{n}{k}$ vertex subsets of size k

$$\text{Running time: } O^* \left(\max \left(2.7^t, \binom{n}{t} \right) \right) = O^*(1.9093^n)$$

This approach gives algorithms faster than $O^*(2^n)$ for subset problems with a parameterized algorithm faster than $O^*(4^k)$.

Subset Problems

An *implicit set system* is a function Φ with:

- Input: instance $I \in \{0, 1\}^*$, $|I| = N$
- Output: set system (U_I, \mathcal{F}_I) :
 - universe U_I , $|U_I| = n$
 - family \mathcal{F}_I of subsets of U_I

Subset Problems

An *implicit set system* is a function Φ with:

- Input: instance $I \in \{0, 1\}^*$, $|I| = N$
- Output: set system (U_I, \mathcal{F}_I) :
 - universe U_I , $|U_I| = n$
 - family \mathcal{F}_I of subsets of U_I

Φ -SUBSET

Input: Instance I

Question: Is $|\mathcal{F}_I| > 0$?

Subset Problems

An *implicit set system* is a function Φ with:

- Input: instance $I \in \{0, 1\}^*$, $|I| = N$
- Output: set system (U_I, \mathcal{F}_I) :
 - universe U_I , $|U_I| = n$
 - family \mathcal{F}_I of subsets of U_I

Φ -SUBSET

Input: Instance I

Question: Is $|\mathcal{F}_I| > 0$?

Φ -EXTENSION

Input: Instance I , a set $X \subseteq U_I$, and an integer k

Question: Does there exist a subset $S \subseteq (U_I \setminus X)$ such that $S \cup X \in \mathcal{F}_I$ and $|S| \leq k$?

Suppose Φ -EXTENSION has a $O^*(c^k)$ time algorithm B .

Algorithm for checking whether \mathcal{F}_I contains a set of size k

- Set $t = \max\left(0, \frac{ck-n}{c-1}\right)$
- Uniformly at random select a subset $X \subseteq U_I$ of size t
- Run $B(I, X, k - t)$

Algorithm

Suppose Φ -EXTENSION has a $O^*(c^k)$ time algorithm B .

Algorithm for checking whether \mathcal{F}_I contains a set of size k

- Set $t = \max\left(0, \frac{ck-n}{c-1}\right)$
- Uniformly at random select a subset $X \subseteq U_I$ of size t
- Run $B(I, X, k-t)$

Running time: (Fomin, Gaspers, Lokshtanov, et al., 2019)

$$O^*\left(\frac{\binom{n}{t}}{\binom{k}{t}} \cdot c^{k-t}\right) = O^*\left(2 - \frac{1}{c}\right)^n$$

Brute-force randomized algorithm

- Pick k elements of the universe one-by-one.
- Suppose \mathcal{F}_I contains a set of size k .

Success probability:

$$\frac{k}{n} \cdot \frac{k-1}{n-1} \cdot \dots \cdot \frac{k-t}{n-t} \cdot \dots \cdot \frac{2}{n-(k-2)} \frac{1}{n-(k-1)} = \frac{1}{\binom{n}{k}}$$

||

$$\frac{1}{c}$$

Randomized Monotone Local Search

Theorem 13 ((Fomin, Gaspers, Lokshtanov, et al., 2019))

If there exists a (randomized) algorithm for Φ -EXTENSION with running time $O^(c^k)$ then there exists a randomized algorithm for Φ -SUBSET with running time $(2 - \frac{1}{c})^n \cdot N^{O(1)}$.*
